Sequence 20, Application US/09548608

GENERAL INFORMATION:

APPLICANT: Qvist, Per

APPLICANT: Bonde, Martin

TITLE OF INVENTION: A method for Assaying Collagen Fragments

TITLE OF INVENTION: in Body Fluids, A Test Kit and Means for C

TITLE OF INVENTION: method and Use of the Method to Diagnose the TITLE OF INVENTION: Disorders Associated with the Metabolism of NUMBER OF SEQUENCES: 21

CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             55; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             491, A

GENERAL INFORMATION
TITLE OF INVENTION: Methods and composition for producing secreted trimeric
TITLE OF INVENTION: Methods and composition for producing secreted trimeric
TITLE OF INVENTION: Teceptor analogs and biologically active fusion proteins
TITLE REFERENCE: 03-052-PL
CURRENT APPLICATION UNDER: US/10/677,877A
CURRENT FILING DATE: 2003-10-02
                            180

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                          771

The human proalpha 1 (1) chain of type I procollagen is compared with those of calf, rat, mouse and chicken and with the proalpha 2 (1) chain from man. Selective pressure during 250,000,000 years of evolution acted more strongly on the proalpha 1 (1) chain than on the proalpha 2 (1) chain. The alpha 2 (1) chain domain as sequences are not as highly conserved as those of the C-propeptide domain of the same chain.

                                                                                                                                                                                                                                                                      8
                          The invention relates to a novel method for generating a secreted trimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion. to the polypeptide to be trimerized, which in turn is joined in-frame to a signal peptide capable of self-trimerization which is heterologous to the first polypeptide capable of self-trimerization which is heterologous to the first polypeptide to be trimerized, and introducing the construct into a cukaryotic cell. Receptor decoys, e.g. soluble receptors consisting of cularyotic cell. Receptor decoys theoretically should have a much ligand and thus overcome the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much higher affinity to their ligand than their dimeric counterparts. Such carionally designed soluble trimeric receptor analogs could significantly increase clinical benefits, as well as lower the amount or frequency of drug injections for each patient. The method of the invention may be useful for generating a secreted trimeric fusion protein to be used for more efficient neutralization of the biological activities of their manners appared a plane of the invention of the human collagen appared to the invention.

The invention relates to a novel method for generating a secreted trimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion, to the polypeptide to be trimerized, which in turn is joined in-frame to a polypeptide to be trimerized, and introducing the construct into a conspect cell. Receptor decoys, e.g. soluble receptors consisting of cukaryotic cell. Receptor decoys, e.g. soluble receptors consisting of only the extracellular ligand-binding domain, may be used to intercept a ligand and thus overcome the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much higher affinity to their ligand than their dimeric counterparts. Such rationally designed soluble trimeric receptor analogs could significantly increase clinical benefits, as well as lower the amount or frequency of drug injections for each patient. The method of the invention may be used for useful for generating a secreted trimeric fusion protein to be used for

The current sequence is that of the human soluble CD4-human collagen alpha(I) C-propeptide T2 fusion DNA (8CD4-T2) of the invention. The collagen T2 construct includes a mutated BMP-1 recognition site but does not contain the glycine-repeat triple helical region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                131

Generating a secreted trimeric fusion protein by introducing into a cell a DNA construct comprising a promoter linked to a template encoding a signal peptide sequence followed by in-frame fusion to polypeptide to be

Claim 17; SEQ ID NO 7; 47pp; English.

trimerized

```
The invention relates to a novel method for generating a secreted trimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion, to the colypeptide capable of self-trimerization which is heterologous to the colypeptide capable of self-trimerization which is heterologous to the ciffret polypeptide to be trimerized, and introducing the construct into a cukaryotic cell. Receptor decoys, e.g. soluble receptors consisting of cukaryotic cell. Receptor decoys theoretically should have a much conjugate and thus overcome the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much retroally designed soluble trimeric receptor analogs could significantly controlly designed soluble trimeric receptor analogs could significantly increase clinical benefits, as well as lower the amount or frequency of cursing injections for each patient. The method of the invention may be conserually occurring trimeric ligands. The current sequence is that of the naturally occurring trimeric ligands. The current sequence is that of the human placental alkaline phosphatase (AP)-human collagen alpha(I) conserual includes a mutated BMP-1 recognition site but does not contain contain region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
